New policy brief on food security

The International Food Policy Research Institute (IFPRI's) Development Strategy and Governance Division (DSGD) in conjunction with the Eastern and Central Africa Programme for Agricultural Policy (ECAPAPA) have issued a new policy brief, titled: **Back to the Future, Reversing Recent Trends for Food Security in Eastern Africa**. The brief can be accessed at: <http://www.ifpri.org/PUBS/ib/ib45.asp>

GENDER AND DEVELOPMENT: BRIDGING THE GAP BETWEEN RESEARCH AND ACTION

Gender equality is a basic human right and should be integral to development. Unfortunately, while practitioners are often knowledgeable about general development or technical issues, many lack the understanding and resources necessary to effectively integrate gender issues into specific projects and public policy. Recent research undertaken by the International Food Policy Research Institute (IFPRI) provides both empirical evidence of the effects of gender and intra-household issues on development intervention outcomes, and specific guidance on how to incorporate research findings effectively into development projects and policy instruments

Introduction

MANY practitioners are not convinced of the importance of gender issues and yet gender considerations can affect the allocation, targeting, and control of resources. Hence, an understanding of how resources are allocated within households can profoundly affect policies associated with the design and implementation of development projects. For specific projects, incorporating research findings can increase their effectiveness. The challenge is to bridge the gap between research and action. It is vitally important—regardless of whether gender issues are taken into account—that programs and policy instruments be backed by rigorous research. In an overwhelming majority of cases from a wide range of developing countries, the conventional wisdom that men and women's resources have the same effects on household decision-making is

rejected. Results indicate that household members have different preferences and do not pool their resources.

Share of resources depends on bargaining power within the household

The inequality in resource distribution between men and women has both economic and social consequences. The collective model predicts that “bargaining power” determines the share of resources allocated to an individual within a household. Regardless of the measure chosen, the distribution of power and resources within the household almost always favors men.

Increasing resources controlled by women: benefits on agriculture, health, and nutrition

In agriculture, if resources are inefficiently allocated within the household, their redistribution, in favor of women, increases yields or leaves them unchanged. Improvements in women’s status and increases in the resources controlled by women are associated with increased allocations toward education and improving child health and nutrition. Further, investment in women, particularly in education, is key to poverty reduction and income improvement.

How local norms and statutory laws determine women’s rights

Despite legal reform, what often determines women’s property rights in practice is how laws are interpreted and implemented at the local level. The relative importance of norms and statutes varies across countries and is also influenced by women’s social class, education, and urban or rural location. In many cases, particularly in rural areas, customs may be more important than statutes.

Increasing women’s resources to achieve successful development outcomes

Innovative measures to increase women’s resources include credit programs targeted to women, programs designed to increase girls’ educational attainment, community day-care programs, and income transfers targeted to women. These programs have had positive effects on women’s earning and decision-making ability and in some cases have conveyed benefits to their children, such as reducing the incidence of illness and the probability of stunting, and increasing attendance at school. In the case of PROGRESA, Mexico’s conditional cash transfer program, for example, the educational attainment of the children of participating mothers was extended by 0.7 years per child on average, and secondary school attendance by girls was increased.

Gender research using project and policy cycles

For purposes of exposition, a development project is determined to have four primary phases: needs assessment and problem identification, project design and appraisal, project implementation and monitoring, and evaluation. Similarly, the process of policymaking also has phases: agenda setting, policy formulation, adoption, implementation, and assessment.

Addressing gender in needs assessment and problem definition

In many cases, the only information on resource allocation is likely to come from qualitative studies, such as interviews with key informants, focus groups, and participant observation. Views of men and women in the community must be solicited separately, especially in cultures where women do not feel free to speak out in the presence of men. Other factors must also be considered that may mediate the effect of gender, such as age, civil status, ethnic makeup, indigenous mixes, and urban versus rural locations.

When designing development projects in countries where poverty rates are higher for women, the nature and causes of poverty in female-headed households and for women in general must be taken into account. It is important to know about the formal and informal organizations to which men and women belong, the criteria for membership, and the actual and perceived barriers to participation. Project planners need to be aware of the supportive roles women play in organizations, even when they are not formal members; the informal channels they use to make their needs known; the extent to which men's and women's needs are perceived as legitimate; and whether channels exist through which these needs can be made known to local authorities or governing bodies. It is important to discern whether mixed or single-sex groups will be more effective. Often it is not legal ownership of a resource but its control that is important, which necessitates an understanding of the relationship between resource control and bargaining power. Project planners must be aware of formal and informal institutions, such as inheritance, marriage, and other institutions that affect gender status, since this will affect the relative status of male and female project participants.

Addressing gender in project design and appraisal

Gender considerations will affect such aspects as the relative priority given to needs and solutions, the choice among different approaches to a particular problem, the need for and nature of the targeting mechanism used, the gender balance of project staff, and the involvement of different stakeholders as participants. Increasing women's control of resources is crucial to attaining many desired project outcomes, such as increased education and improved health of children. However, women's participation in projects may have unintended consequences, such as on time use. When designing human capital interventions, it is important to discover the constraints to increasing school attendance, retention rates, regularity of health visits, and so on. These constraints may be financial, social, or cultural, and they may vary by gender. If the constraints are financial, conditional transfer programs may be viable. If cultural factors are important, information, communication, and education (ICE) activities should be incorporated into the program. If human capital outcomes are worse for women, design features can increase incentives selectively for girls. Helping women fulfill domestic responsibilities such as child care may be important to increasing their participation in the labor force.

Addressing gender in project implementation, monitoring, and evaluation

Measuring the performance of development projects is essential to increasing their effectiveness. Targeting mechanisms, levels of staff training, the gender composition of staff, and even the extent to which service providers understand project objectives may have an important effect on the project's success in reaching its beneficiaries and, thus, the project's overall performance.

Monitoring provides policy-relevant knowledge that assists in project implementation. It is also important that unintended project consequences be brought to light. Evaluation enables project implementers to draw lessons for future experience, ultimately increasing impact. Project beneficiaries may have strong preferences for the gender of providers, a factor that should be taken into account when determining staffing plans. Quota-based targeting may have unintended effects if field workers—who may be evaluated based on the quota—attempt to meet it without paying attention to intra-household dynamics. Targeting based on one objective (gender equity) may at times run counter to other program objectives (say, increased yields or profits) if women do not have equal access to productive resources and if the project does not include specific provisions to equalize women's access to resources.

Increasingly, quantitative studies are being complemented by qualitative studies, which provide project planners with direct views from different stakeholders. Whether quantitative studies can do before/after comparisons, however, critically depends on the existence of baseline data. Therefore, it is important for evaluators to be involved in project design, so that evaluation can be built into project implementation and the collection of monitoring indicators at the local level. Implementers should pay attention to feedback from male and female stakeholders in designing project modifications; the use of participatory methods can help to ensure their continued involvement.

Implications of gender research for policymakers

Policymakers are a rather amorphous group, such that informing policy is more of an art than a science. Thus, gender and intra-household research findings should be viewed as a lens through which the policy agenda is set. This involves asking pertinent questions, scrutinizing policy options, determining levels of risk, and monitoring policy outcomes. Policymakers should not assume that the impacts of policies will be the same for all household members. Development policies in countries where poverty rates are higher for women must take into account the nature and causes of poverty among female-headed households and among women in general. Policymakers should examine the extent to which statutory laws regarding property rights discriminate against women. At the same time, they should be aware that legal reforms may be nullified by customary practice. Even countries with highly equitable legal systems may have local customs that discriminate against women. When forecasting policy impact, titling or other land legislation should be examined for its effect on women's land rights. However, attempts to increase women's incomes or agricultural productivity by equalizing land rights will only succeed if other constraints facing women, such as limited access to credit, labor shortages, and lack of seed and other inputs, are also addressed. Policymakers need to examine trade-offs between acceptability and long-term development objectives when implementing policies whose success may be conditioned on social and cultural constraints that may vary by gender. As for projects, when constraints are financial, conditional transfer programs may be viable; when cultural factors are at issue, ICE activities should be incorporated; and when human capital outcomes are worse for women, design features should target girls.

Policymakers should invest in an information system that collects sex-disaggregated data to enable them to ascertain the gender-specific impact of policies, track progress, and ensure consistency with other national development objectives. The choice of evaluation method depends on the developmental objectives, the scale of the policy implementation, and resources and data available for evaluation. Policymakers should pay attention to feedback from male and female stakeholders

when proposing changes to existing policies and interventions. In some cases, no modification is good modification because policies may be achieving the desired outcomes if they have been sensitive to the gender implications of resource use within households.

ECAPAPA welcomes your comments, suggestions and encourages article submissions.

COMMUNICATION

Fellowships and grants

1. **The Netherlands Fellowship Programmes (NFP)** is now accepting applications for professional development. For eligibility and further information, visit: <http://www.nuffic.nl/nfp/>
2. **The Five Colleges African Scholars Residency Program** invites junior and mid-level African scholars, employed by and teaching in African universities and with active research projects with an African focus, to apply for residence at Amherst College; Hampshire College; Mount Holyoke College; Smith College and the University of Massachusetts Amherst and neighboring institutions associated in the Five Colleges Consortium centered in Amherst, Massachusetts, in order to complete their projects. Residents are expected to complete scholarly projects with the goal of publication either by the end of the residency or shortly thereafter. Scholars are provided with laptop computers, which they may retain once the residency is complete, to sustain subsequent contact by e-mail. For more information, visit: <http://www.fivecolleges.edu> The deadlines for receipt of applications is **01 June and 01 December** annually.
3. **The International Foundation for Science (IFS)** and the **Council for the Development of Social Science Research in Africa (CODESRIA)** invite young researchers with a Masters or PhD level degree and are at the beginning of their research careers to apply for grants. Full details about this opportunity, including eligibility requirements and instructions on how to apply, are available at www.ifs.se The deadline for applications is **31 May 2006**.
4. UNESCO Fellowships Programme invites qualified candidates to apply for short term professional development under its priority areas. For details, including a list of UNESCO's priority areas, visit: <http://portal.unesco.org> The deadline is **30 April 2006**.
5. The Commonwealth **Scholarship & Fellowship Programme** invites mid-career practitioners in developing countries, working in the areas of education, engineering, environment, governance, public health and technology to apply for short term fellowships to deepen their skills and understanding of the above development challenges. For more information, visit: www.csfp-online.org The deadline is **30 April 2006**.

ECAPAPA received this information from Steven Omamo Were, IFPRI, Kenya. He is gratefully acknowledged.

This newsletter is an attempt to use e-communications to provide to a broad audience within and outside Eastern and Central Africa a mechanism for distribution and exchange of information relevant to agricultural policy issues. This newsletter is being sent to identified stakeholders of ECAPAPA. We want to respect your privacy and desire not to have your e-mail inbox filled with unwanted correspondence. If you do not want to receive this newsletter please send us a note at <ecapapa@asareca.org >, and we will remove your name from the distribution list. For back issues of this newsletter, go to 'View Archive' at www.asareca.org/ecapapa

ECAPAPA is a regional programme of the Association for Strengthening Agricultural Research in Eastern and Central Africa (ASARECA). ECAPAPA is receiving support from a number of organizations including, BMZ/GTZ, EU, IDRC, SDC, and USAID. This newsletter is supported by a grant from the Swiss Agency for Development and Cooperation (SDC). The editorial content of the newsletter is solely the responsibility of the Co-ordinating Unit of ECAPAPA.
